Supabase

Product Manager, AI

5 June 2026

Dear Supabase team,

Last month I ran into a Supabase edge function timeout issue inside a production n8n workflow. The MCP server connecting Claude Code to my Supabase instance was holding a connection open longer than the function's default limit, causing silent failures that only surfaced three nodes downstream. I fixed it by adjusting the timeout config, documented what happened, and shipped a workaround for the research team I support. That's a normal Tuesday for me. I run Supabase in production. I use Claude Code with MCP daily. I hit these failure modes before they reach your enterprise customers -- because I'm building with these tools right now.

I'm applying for the Product Manager, AI role because the "founding experience with strong product instincts" OR clause describes me accurately. I co-founded Tonomy Foundation, where I owned the product roadmap and all architecture decisions for an open-source identity platform from zero to W3C Credentials Community Group recognition. I also contributed to the W3C CCG Conditional Proof standard implementation in the did-jwt library -- I know how open standards become developer tools from the inside, not just from reading specs. At Windesheim University I've shipped multiple AI infrastructure products (the Value Chain Hackers AI compliance stack, the Beer Game blockchain simulator, the research AI environment running Flowise and n8n), PM'd them through requirement discovery, user feedback cycles, and production rollout. This isn't developer tools PM at a company that ships products at Supabase's scale -- but it's the pattern of how products get decided and shipped.

The MCP server PM work specifically is what excites me. I use Claude Code with MCP daily. I understand the developer UX challenges of the tool-calling abstraction, the auth handoff friction, and the "why did the agent call the wrong function" debugging loop. I have opinions about what a well-designed MCP server should and shouldn't expose, formed from having used and built integrations against the pattern. That's the kind of informed judgment that's hard to fake -- and it's genuinely what I bring to this role.

I'm fully async-native, fully remote-capable, and based in the Netherlands (CET). I'm happy to work through any gaps in formal developer tools PM track record in a conversation. The user-perspective angle in the JD is real, and I think I'm the person you're describing.

With best regards,

Christiaan Verhoef
